

## **ABSTRACT**

An extendable structure comprising a pair of box-type frames, consisting of parallel rails that expand to the length of the inside of a cabinet. Wires, in the shape of the inverted letter U, or pegs, are inserted vertically through holes in the rails to fix the rails and serve as separators to the platters, trays, plates, etc. The rails are supported by legs, which are mounted on glides. The glides, attached to the bottom of the cabinet, slide in a perpendicular direction to the rails and allow the entire platter/tray to be glided in and out of the cabinet for viewing and utilization.
